

ABSTRACT OF THE DISCLOSURE

A semiconductor ring laser gyro comprising two or more ring lasers, the ring lasers being optically independent of each other, is characterized in that a
5 change in beat frequency with respect to a change in angular velocity of a first ring laser is opposite to that of a second ring laser, and angular velocity of rotation of the gyro is detected by a signal
representing a difference between a first beat
10 frequency generated by the first ring laser and a second beat frequency generated by the second ring laser.
